

Project Title: Research Paper Recommendation System using n8n

Problem Statement

Researchers and students spend a lot of time manually searching for relevant research papers across multiple platforms. Finding related papers, organizing them, and keeping track of recommendations is a repetitive and time-consuming process.

This project automates the entire workflow by allowing users to enter a research paper title through a simple form. The system automatically searches for related research papers using the OpenAlex API, stores the results in Google Sheets, and sends instant recommendations to Telegram.

Solution

The proposed system uses **n8n workflow automation** to:

- Accept a research paper title as input.
- Search for similar research papers automatically.
- Extract paper details (Title, Year, DOI, URL).
- Store recommendations in Google Sheets.
- Send real-time notifications via Telegram.

Impact

- Saves researchers' time.
- Simplifies literature review.
- Automates paper discovery and management.
- Provides instant access to recommended papers.
