

PROJECT TITLE

TruthTerms AI: Retrieval-Augmented Terms & Conditions Understanding and Risk Analysis System

Problem Statement

Most users accept Terms & Conditions and Privacy Policies without reading them because they are lengthy and difficult to understand. As a result, users may unknowingly agree to clauses related to data sharing, hidden charges, automatic renewals, or account restrictions.

TruthTerms AI is a RAG-based system that allows users to upload legal documents and ask questions in natural language. The system retrieves relevant clauses, provides accurate answers, simplifies complex legal text, and highlights potentially risky terms. This helps users quickly understand important information and make informed decisions before accepting legal agreements.

Objectives

- Extract and process legal documents.
- Retrieve relevant clauses using semantic search.
- Answer user queries accurately.
- Detect and highlight risky clauses.
- Simplify legal language into easy-to-understand summaries.
